PEM® INGRESS PROTECTION SELF-CLINCHING FASTENERS

PEM® INGRESS PROTECTION SELF-CLINCHING, FLUSH-HEAD STUDS

Sealed joint without the need for O-rings or sealants

Introducing the PEM® IFH™ ingress protection capable flush-head fastener, designed to create a sealed joint without the need for O-rings or sealants. Unlike standard FH™ fasteners, the IFH™ features enhanced material interaction to provide ingress protection upon installation.

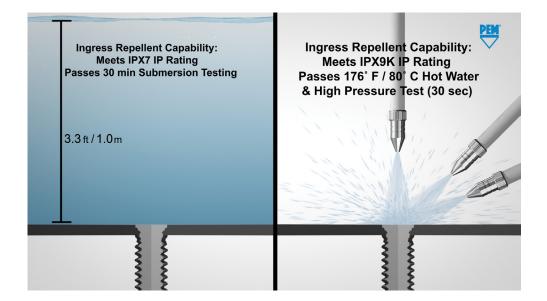

Key benefits include:

- Instant Sealing No curing time required
- Long-Term Reliability No perishable O-rings or additional sealing components.
- Proven Performance Meets ISO:20653-2014 standards, including IPX7 & IPX9K ratings.
- Versatile Applications Tested in CR4, 6082-T6, and 304 stainless materials.

PEM® IFH™ ingress protection capable flush-head studs provide a reliable and efficient solution for ingress protection, eliminating the need for additional sealing components.

PEM® ingress capable studs are available in steel (Type IFH™), stainless steel (Type IFHS™), aluminum (Type IFHA™) and A286 stainless steel (Type IFHP™).

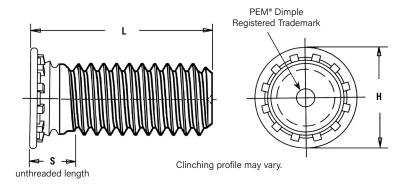

Application Details

- Sheet hardness must be consistently below maximum panel hardness published for the fastener type.
- Published minimum centerline to edge distance must be maintained on all sides.
- Secondary operations such as sheet bending after fastener installation should be avoided, as they may cause deformed material to be pulled out of the joint, leading to a leak path
- For more information on proximity to bends and distance to other clinch hardware, see PEM® Tech Sheet C/L To Edge.

Fastener drawings and models are available at www.pemnet.com. Custom sizes are available on special order. Contact us for more information.

For plated studs, Class 2A/6g, the maximum major and pitch diameter, after plating, may equal basic sizes and be gauged to Class 3A/4h. Per ASME B1.1, Section 7, Paragraph 7.2 and ASME B1.13M, Section 8, paragraph 8.2.
 HRB - Hardness Rockwell "B" Scale. HB - Hardness Brinell.
 See PEM Technical Support section of our web site for related plating standards and specifications.

Installation - IFH™/IFHS™/IFHA™ Threaded Studs

- 1. Prepare properly sized mounting hole in sheet. Do not perform any secondary operations such as deburring.
- 2. Insert stud through mounting hole (punch side) of sheet and into anvil hole.
- With punch and anvil surfaces parallel, apply squeezing force to embed the head of the stud flush in the sheet.

Installation Tooling

Installation - IFHP™ Studs For Stainless Steel Sheets

- Prepare properly sized mounting hole in sheet. Do not perform any secondary operations such as deburring.
- 2. Insert stud through mounting hole (punch side) of sheet and into anyil hole.
- 3. With punch and anvil surfaces parallel, apply squeezing force to embed the head of the stud flush in the sheet.

For IFHP studs, a special anvil with a raised ring is required to create a proper installation. The raised ring acts as a second displacer of the stainless sheet material, thereby ensuring that the annular groove is filled. Please see page 3 for recommended sheet thickness range.

The special anvils are available from PEM stock or can be machined from suitable tool steel. A hardness of HRC 55 / HB 547 minimum is required to provide long anvil life. We recommend measuring the "P" dimension every 5000 installations to ensure that the anvil remains within specification.

Installation Tooling

Installation Details

- Any contaminations of the sheet or fastener could lead to insufficient material flow movement, leading to a leak point.
- Lubricants on the panel could leave leak paths after they evaporate.
- Installation in the punch side on minimum diameter punched holes is preferred. Punch to die clearance can follow industry standards.
- Ingress protection joint is formed directly after proper installation no secondary sealing is required.

| | M5 | 4.4 | 1.5mm Stainless Steel | 86 | 53 | 3560 | 7.35 | 7320 |

⁽¹⁾ Published installation forces are for general reference. Actual set-up and confirmation of complete installation should be made by observing proper seating of fastener as described in the installation steps. Installation force and torque-out values reported are averages when all proper installation parameters and procedures are followed. Variations in mounting hole size, sheet material, and installation procedure may affect performance. Performance testing this product in your application is recommended. We will be happy to provide technical assistance and/or samples for this purpose.

(2) Tightening torque shown is a theoretical value calculated to induce a load of 75% of minimum axial yield strength of the stud with an assumed K value or nut factor equal to

^{0.20.} In some applications tightening torque may need to be adjusted based on the actual K value.

⁽³⁾ Performance values shown are typical for fasteners properly installed using raised ring tooling in good condition. We recommend replacing installation tooling when the height of the "P" falls out of tolerance (see page 4). Reductions in performance may occur as the height of the protrusion wears. Variations in hole preparation, installation force, and sheet material type, thickness, and hardness will affect both performance and tooling life.

⁽⁴⁾ Performance may be reduced for studs installed into thicker sheets.

All PEM® products meet our stringent quality standards. If you require additional industry or other specific <u>quality certifications</u>, special procedures and/or part numbers are required. Please contact your local sales office or representative for further information.

Regulatory <u>compliance information</u> is available in Technical Support section of our website. Specifications subject to change without notice. See our website for the most current version of this bulletin.
